Global Discrimination Incident Analysis Report

1. Project Overview

This project analyzes simulated global discrimination incidents against migrants between 2016 and 2024. The goal is to identify patterns in reported incidents across countries, incident types, and major global events such as the COVID-19 pandemic.

The analysis pipeline includes data cleaning in Python, analytical queries in SQL, and interactive visualization through a Power BI dashboard.

2. Dataset Description

The dataset contains simulated incident records inspired by publicly reported discrimination trends. It includes the following fields:

Year – year of the reported incident
Country – country where the incident occurred
Incident Type – category of discrimination incident
Victims – number of victims reported
Event – global contextual event during the period

The dataset covers:

- **9 years of data**
- **6 countries**
- **5 incident categories**
- **346 total incidents**
- **4189 victims**

3. Key Analysis Questions

This analysis aims to answer the following questions:

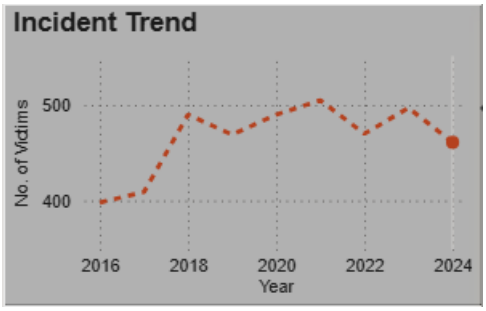
- Which countries report the highest discrimination incidents?
- How have incidents changed over time?
- What types of incidents are most common?
- Did global events influence incident levels?

4. Key Findings

Incident Trend Over Time

The trend analysis shows that discrimination incidents increased significantly between 2016 and 2018, reaching a peak around 2021. After this period, incidents fluctuate but remain relatively high compared to earlier years.

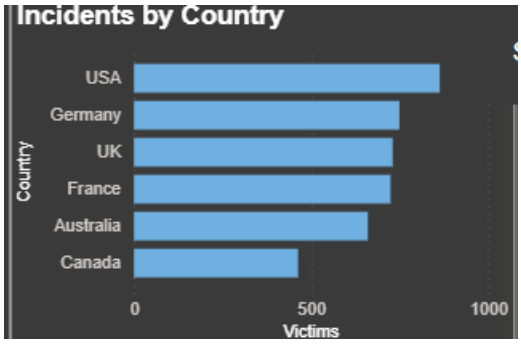
This indicates that **global socio-political events may influence discrimination patterns over time**.



Incidents by Country

Key observation:

- **USA reported the highest number of victims**
- Germany and the UK follow closely
- Canada and Australia reported comparatively lower totals



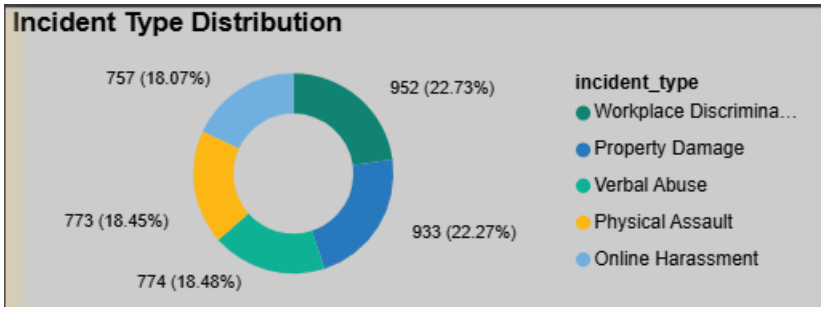
This suggests that **larger migrant populations or higher reporting systems may influence incident counts**.

Incident Type Distribution

The most common incident categories were:

- Workplace discrimination
- Property damage
- Verbal abuse

These account for the majority of recorded incidents.

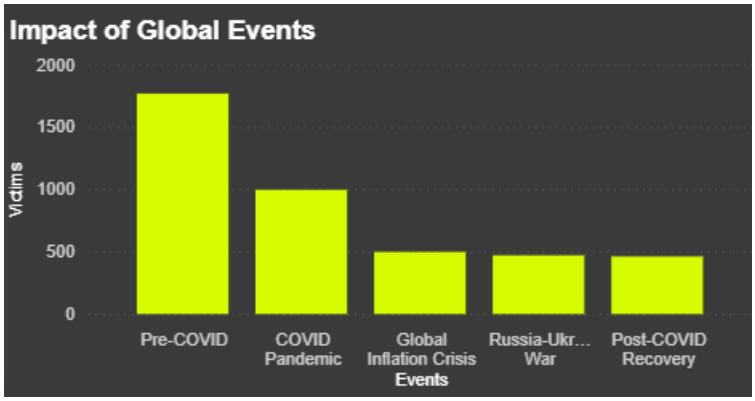


This suggests that **non-physical forms of discrimination are more frequently reported than physical assaults**.

Impact of Global Events

The event comparison shows:

- The **Pre-COVID period recorded the highest victim count**
- The **COVID pandemic period also shows a significant spike**
- Later events such as global inflation and geopolitical conflicts show moderate incident levels.



This suggests that **periods of social or economic stress may correlate with increased discrimination incidents**.

---

5. Dashboard Overview

The Power BI dashboard provides an interactive view of the analysis.

Main components include:

- KPI cards summarizing victims, incidents, countries, and years
- Line chart showing incident trends
- Donut chart illustrating incident type distribution

- Bar chart comparing countries
- Column chart analyzing global event impact
- Interactive filters for country, year, incident type, and event

---

6. Tools Used

This project demonstrates an end-to-end data analysis workflow using:

- **Python (Pandas)** for data cleaning and exploration
- **SQL** for analytical queries and aggregation
- **Power BI** for interactive data visualization

7. Conclusion

The analysis highlights how discrimination incidents vary across countries, incident categories, and global events. While the dataset is simulated for educational purposes, the project demonstrates how data analysis tools can be used to explore patterns, identify trends, and support evidence-based insights.
